</thead>
<tbody>
<tr>
<td>1. Would it possible to consider waiving automatic filter regeneration function from the technical specification (LOT 2) or alternatively will it be accepted if equipment offered doesn’t have this feature?</td>
<td>The automatic filter regeneration function is desired, but not necessary. Mobile insulating oil filtration/dehydration plants without automatic filter regeneration for the removal of moisture from the transformer insulating oil are also acceptable. Appendix 1 ToR p. 11 Section 5.2.2 Design – “The plant shall be incorporated with Automatic filter regeneration. The large capacity adsorbent filters shall be automatically regenerated (re-dried) by the system through an internal process at regular intervals. Upon completion of the regeneration process, the system shall automatically restart in the moisture removal cycle.”</td>
